

Create Your First Lambda Function

To Begin with the Lab

Summary of the Lab

AWS Lambda is an event-driven compute service that runs code in response to events. In this lab, you created your first Lambda function using **Author from scratch**, selected the **Python runtime**, configured the default execution role, and understood the purpose of the `lambda_handler` (event, context) function.

Lab steps

Step 1-Open AWS Lambda

- Go to the search bar and search Lambda
- Click on the Lambda

Step 2- Create a Lambda Function

- Click on the Create Function

Step 3- Configure the Function

- Choose Author from scratch
- Provide the any Function Name
- Choose the Python language, that provide a lambda code

- Click on the Create Function

Custom settings Info

Durable execution - new ⓘ

Build resilient, stateful applications with automatic failure recovery.

EC2 capacity provider - new ⓘ

Run Lambda on your preferred EC2 instance types instead of Lambda's serverless compute (default).

► **Additional settings**
 Customize your function architecture, execution role, HTTPS endpoints, tenant isolation mode, VPC, code signing, KMS key, and tags.

ⓘ Cannot add or remove after creation

Step 4: Write the code

- Write the code for execution
- Click on the Deploy

```
def lambda_handler(event, Context)
    return ("Hello Word")
```

✓ Successfully updated the function "Hello_world".

Code source Info

EXPLORER

- HELLO_WORLD
 - lambda_function.py

lambda_function.py

```
1 def lambda_handler(event, context):
2     return ("Hello World")
```

DEPLOY ✓ Current

[Deploy \(Ctrl+Shift+U\)](#) [Test \(Ctrl+Shift+I\)](#)

Step 6: Create a test event

- Create new test event
- Provide Event Name

- Save

Step 7: Run the function

- Click again on the Test
- View the output and CloudWatch logs
